

“Use of DACC-coated antimicrobial dressing in people with diabetes and a history of foot ulceration.” (Haycocks)

- **Objective:** Demonstrate effectiveness of Sorbact® in the prevention and management of infection in diabetic foot wounds (case series). Both wounds had a history of osteomyelitis and soft tissue infection in patients with predominantly neuropathic feet.
- **Results:** Sorbact® successfully helped prevent wound re-infection and enable the wounds to move on to complete healing.
- **Conclusion:** The dressings offer an alternative to the use of established antimicrobial products.
